

Gα t1 (M104) polyclonal antibody

Catalog: BS3311

Host: Rabbit

Reactivity: Human, Mouse, Rat

Background:

Heterotrimeric G proteins function to relay information from cell surface receptors to intracellular effectors. Each of a very broad range of receptors specifically detects an extracellular stimulus (a photon, pheromone, odorant, hormone or neurotransmitter) while the effectors (i.e. adenylyl cyclase), which act to generate one or more intracellular messengers, are less numerous. In mammals, G protein α , β and γ polypeptides are encoded by at least 16, 4 and 7 genes, respectively. Most interest in G proteins has been focused on their α subunits, since these proteins bind and hydrolyze GTP and most obviously regulate the activity of the best studied effectors. Four distinct classes of G α subunits have been identified; these include Gs, Gi, Gq and G α 12/13. The Gi class comprises all the known α subunits that are susceptible to pertussis toxin modifications, including G α i-1, G α i-2, G α i-3, G α o, G α t1, G α t2, G α z and G α gust. In the well characterized visual system, photorhodopsin catalyzes the exchange of guanine nucleotides bound to the visual transducin G α subunits (G α t1 in rod cells and G α t2 in cone cells).

Product:

Rabbit IgG, 1mg/ml in PBS with 0.02% sodium azide, 50% glycerol, pH7.2

Molecular Weight:

~ 40 kDa

Swiss-Prot:

P11488

Purification&Purity:

The antibody was affinity-purified from rabbit antiserum by affinity-chromatography using epitope-specific immunogen and the purity is > 95% (by SDS-PAGE).

Applications:

WB: 1:500~1:1000

Storage&Stability:

Store at 4 °C short term. Aliquot and store at -20 °C long term. Avoid freeze-thaw cycles.

Specificity:

G α t1 (M104) polyclonal antibody detects endogenous levels of G α t1 protein.

DATA:

Western blot (WB) analysis of G α t1 (M104) pAb at 1:500 dilution

Lane1: The Eye tissue lysate of Mouse(20ug)

Lane2: The Eye tissue lysate of Rat(20ug)

Note:

For research use only, not for use in diagnostic procedure.
