Recombinant IFN- γ , Mouse

Catalog Number: BK0081-20 μ g

Source: Escherichia coli.

Quantity: 20 μ g

Description:

Sharing 41% sequence identity with human Interferon gamma (hIFN- γ), mouse IFN gamma (mIFN- γ) is a macrophage-activating factor. The active form of IFN- γ is an antiparallel dimer that sets off IFN- γ /JAK/STAT pathway. IFN- γ signaling does diverse biological functions primarily related to host defense and immune regulation, including antiviral and antibacterial defense, apoptosis, inflammation, and innate and acquired immunity. While IFN- γ -induced inflammatory cascade summons a variety of immune-related cell types, such as macrophages, natural killer (NK) cells and cytotoxic T lymphocytes (CTLs), IFN- γ is also implicated in resistance to NK cell and CTL responses and in immune escape in a variety of cancers. Recombinant mouse IFN gamma (rmIFN- γ) produced in E.coli is a non-glycosylated polypeptide chain of 134 amino acids. A fully biologically active molecule, rmIFN- γ has a molecular mass of 15 kDa analyzed by reducing SDS-PAGE and is obtained by proprietary refolding and chromatographic techniques at GenScript.
