## Recombinant TEV Protease, His

Catalog Number: BK0165-10000IU

Source: Escherichia coli.

Quantity:  
10000IU

### Description:

Tobacco Etch Virus Protease is a highly site-specific cysteine protease that is found in the Tobacco Etch Virus (TEV). The optimum recognition site for this enzyme is the sequence Glu-Asn-Leu-Tyr-Phe-Gln-(Gly/Ser) [ENLYFQ(G/S)] and cleavage occurs between the Gln and Gly/Ser residues. The most commonly used sequence is ENLYFQG. The protease is used to cleave affinity tags from fusion proteins. The optimal temperature for cleavage is 30 °C; also it can be used at temperature as low as 4 °C. It is recommended that the cleavage for each fusion protein be optimized by varying the amount of recombinant viral TEV protease, reaction time, or incubation temperature. It can be removed by Ni<sup>2+</sup> affinity resin. Recombinant Tobacco Etch Virus Protease (rTEV) contains 231 amino acids with N-terminal His tagged. A fully biologically active molecule, rTEV has a molecular mass of 28.4 kDa and is obtained by proprietary chromatographic techniques at GenScript.

### Molecular Weight:

28.4 kDa, observed by reducing SDS-PAGE.

### Purity:

> 95% by SDS-PAGE analyses.

### Biological Activity:

6 IU/μl. Unit Definition: One unit of TEV protease

cleaves > 85% of 3 μg of control substrate in 1 hour at pH 8.0 at 30 °C.

### Physical Appearance:

Sterile Filtered White lyophilized (freeze-dried) powder.

### Formulation:

Sterile liquid solution contains 50mM Tris, 5mM DTT, 50% glycerol, pH7.5.

### AA Sequence:

### Endotoxin:

### Reconstitution:

### Storage:

Recombinant Tobacco Etch Virus Protease (rTEV) remains stable up to 1 year at -20 °C from date of receipt. Please avoid freeze-thaw cycles.

### Usage:

This material is offered by USA Bioworld biotech for research, laboratory or further evaluation purposes. For research use only.
