

## Nucleophosmin (E22) polyclonal antibody

Catalog: BS2353

Host: Rabbit

Reactivity: Human, Mouse, Rat

### Background:

The transport of proteins across the nuclear envelope is a selective, multi-step process involving several cytoplasmic factors. Proteins must be recognized as import substrates, dock at the nuclear pore complex and translocate across the nuclear envelope in an ATP-dependent fashion. Several cytosolic and nuclear proteins that are central to this process have been identified. For example, two cytosolic factors critically involved in the recognition and docking process are the karyopherin  $\alpha$  and karyopherin  $\beta$  proteins. The karyopherin holoenzyme is a heterodimer of  $\alpha$  and  $\beta$  subunits.
