

IFNB1 polyclonal antibody

Catalog: BS60295

Host: Rabbit

Reactivity: Human, Mouse, Rat

BackGround:

The genes encoding type I interferons (IFNs), which include 14 IFN- α genes, one IFN- β gene, one IFN-w (also known as IFN- α II1) gene, and a number of IFN-w pseudogenes, are clustered on human chromosome 9. Interferons- α and - β are cytokines that are widely known to induce potent antiviral activity. IFN- α and - β exert a variety of other biological effects, including antitumor and immunomodulatory activities and are increasingly used clinically to treat a range of malignancies, myelodysplasias and autoimmune diseases. IFN-w is antigenically different from human IFN- α , IFN- β or IFN- γ , but is a component of natural mixtures of IFN species produced by virus-induced leukocytes or Burkitt's lymphoma cells. The type I interferon receptor (IFN- α R) interacts with IFN- α , IFN- β and IFN-w, and seems to be a multisubunit receptor.
