

VAV1 polyclonal antibody

Catalog: BS76125

Host: Rabbit

Reactivity: Human, Mouse, Rat

BackGround:

This gene is a member of the VAV gene family. The VAV proteins are guanine nucleotide exchange factors (GEFs) for Rho family GTPases that activate pathways leading to actin cytoskeletal rearrangements and transcriptional alterations. The encoded protein is important in hemato-poiesis, playing a role in T-cell and B-cell development and activation. The encoded protein has been identified as the specific binding partner of Nef proteins from HIV-1. Coexpression and binding of these partners initiates pro-found morphological changes, cytoskeletal rearrange-ments and the JNK/SAPK signaling cascade, leading to increased levels of viral transcription and replication. Al-ternatively spliced transcript variants encoding multiple isoforms have been observed for this gene.
